1 Summary

2 Contramap & emap

Contramap: Creates a new encoder that applies first a function than the old encoder.

```
implicit val encodeInstant: Encoder[Instant] =  
  Encoder.encodeString.contramap[Instant](_.toString)}
```

Emap: Creates a new decoder by applying the old decoder and then a function.

```
implicit val decodeInstant: Decoder[Instant] = Decoder.decodeString.emapTry { str =>  
  Try(Instant.parse(str))  
}
```
